Snapshot collected UTC	2026-10-20T11:15:52Z
Events exported	14
Source system	SYNTHETIC TEST INPUT (NOT LIVE EVIDENCE)
Original source file acquired	NO - LOG SNAPSHOT ONLY
Data cap status	Within collection limit; coverage not assured

1. Scope and methodology

The collector exported matching audit and endpoint activity events. The report presents observations recorded in those sources; it does not assert comprehensive history, full content lineage, or live file-location verification. The underlying Log Analytics source data were not forensically imaged.

2. Findings summary

14 matching log events; 5 logged principals; 2 recorded moves/copies; 4 email rows; 4 upload/download rows; 6 filename/message candidates. These counts do not prove every access or descendant copy.

Accounts observed: alice@example.invalid, bob@example.invalid, charlie@example.invalid, david@example.invalid, eve@example.invalid

Last recorded location: cloudapp:Box/Financial-Report.xlsx (event timestamp 2026-10-05T17:00:00Z). This is NOT a verified current location.

3. Chronological evidence (sample of preserved events)

4. Recorded movement links

Graph shows explicit logged move/copy edges only; destination existence is not independently confirmed.

5. Email attachments, mail delivery, uploads and downloads

Email attachment processing does not demonstrate delivery. EmailEvents entries with the same NetworkMessageId describe message routing/delivery, not a proven causal transfer of the investigated original file. A filename match is a candidate; even equal hashes alone cannot prove the transfer path. SMTP delivery status does not prove the recipient opened or saved the file.

7. Evidential limitations

Log-only acquisition; incomplete reads possible; throttled M365 audit events; workspace retention limitations; matching filename/path does not prove identity across copies; an account is not conclusive human attribution; encrypted packaging alone does not establish legal admissibility. Reconcile original Microsoft 365 audit records and Graph item IDs independently before conclusions.
